DETAILED ACTION
EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Keith J. Wood, Reg. No 45,235 on October 01, 2007.

The application has been amended as follows:

In the claims:

1. (Currently amended) In a computer network, apparatus for mapping data between different security domains, the apparatus comprising:

a communication module stored on a computer-readable medium, ~~the communication module for~~ establishing a communication connection between a sender of one security domain and a receiver in a different security domain, wherein the communication connection is a secure communication channel formed by the communication module (i) authenticating the sender with the communication module and authenticating the receiver with the communication module, resulting in an authorized sender and authorized receiver, and (ii) encrypting working data transmitted over the channel;

a mapping module stored on a computer-readable medium coupled to the communication module, the mapping module ~~for~~ anonymously mapping working data of the one security domain to working data of the different security domain, the working data having (i) a research data portion and (ii) a personal identifier portion related to identifying a person associated with the research data portion, the mapping module mapping the personal identifier portion of the working data in the one security domain to the personal identifier portion of

the working data in the different security domain such that the working data transmitted to the receiver over the secure communication channel is anonymous data, while leaving the research data portion unmapped by the anonymous mapping of the personal identifier portions; and

a secret sharing module stored on a computer-readable medium, ~~the secret sharing module for~~ performing secret sharing to control keyholder access to the mapping module such that a predetermined number of keyholders greater than one is required to compromise access to the mapping module;

the apparatus communicating between parties comprising at least the sender and the receiver in at least two different security domains;

wherein the communication module ~~is capable of~~ (i) transmits ~~transmitting~~ both the anonymously mapped personal identifier portion and the unmapped research data portion of the working data to the receiver over the secure communication channel, and (ii) transmits ~~transmitting~~ from the receiver to the sender a return of the working data based on a reverse mapping performed by the mapping module;

and wherein the anonymous mapping of the personal identifier portion is a one-to-one mapping.

20. (Currently amended) A method for transferring and mapping data between different security domains in a computer network, comprising the steps of:

using a communication module stored in a computer-readable medium, establishing a communication connection between a sender in one security domain and a receiver in a different security domain, wherein the communication connection is a secure communication channel formed by the communication module (i) authenticating the sender with the communication module and authenticating the receiver with the communication module, resulting in an authorized sender and authorized receiver, and (ii) encrypting working data transmitted over the channel;

using the communication module, transmitting working data from the authorized sender to the authorized receiver, the working data having (i) a research data portion and (ii) a personal identifier portion related to identifying a person associated with the research data portion;

using a mapping module stored in a computer-readable medium, anonymously mapping the working data of the one security domain to working data of the different security domain by mapping between the personal identifier portion of the working data in the one security domain and the personal identifier portion of the working data in the different security domain, the mapping between the personal identifier portions being performed such that the working data received by the receiver over the secure communication channel is anonymous data, while leaving the research data portion unmapped by the anonymous mapping of the personal identifier portions;

using a secret-sharing module stored in a computer-readable medium, controlling keyholder access to the mapping using secret sharing such that a predetermined number of keyholders greater than one is required to compromise access to the mapping module; and

transmitting from the receiver to the sender a return of the working data based on a reverse mapping performed by the mapping module;

wherein transmitting the working data from the sender to the receiver using the communication module comprises transmitting both the anonymously mapped personal identifier portion and the unmapped research data portion of the working data to the receiver over the secure communication channel;

~~wherein the communication module is capable of transmitting from the receiver to the sender a return of the working data based on a reverse mapping performed by the mapping module; and~~

wherein the anonymous mapping of the personal identifier portion is a one-to-one mapping.
